

# Social Search Assignment

## Social Search

We've read about how people in Stanley Milgram's experiments used their personal networks to find a target person. You're going to use your personal networks to find a Purdue student who has a driver's license from Hawaii. If you personally have one, you'll need to find someone else that has one too.

The rules:

1. You can only ask one person at a time (i.e., no using social media or group texts)
2. You can only contact people that you know on a first-name basis and who know you on a first-name basis
3. You can't contact other people in this class
4. For those you ask, ask them who they asked and build a diagram of your network search
5. Once your network finds someone, trace that entire path

Write up a brief report of your experience, including the following information:

- 1) Include your search diagram.
- 2) How many fresh starts were there in your search?
- 3) How many people were involved in total?
- 4) What was the longest search chain that you had?
- 5) How long was the chain – measured in links – that ultimately lead you to a target person?
- 6) What strategy did you use in your search? When writing up your search strategy, try to describe them in terms of ideas that we have learned about in class.
